Since 1954

## Company History

### *Proud of the Past, Prepared for the Future*

**I**n 1954, Abbott Engineering and Manufacturing Co. began producing soft jaws and specialized tooling on a sub-contract basis in Phoenix, AZ. The business initially consisted of one employee operating out of a rented Quonset hut, but quickly matured into a dynamic, profitable corporation.

In 1955, Abbott built the nation's first Pie Jaw® brand chuck jaw. This new type of jaw eliminated the problems inherent in rectangular jaws. Drawing on their experience and expertise, Abbott began testing their concept thoroughly. The prototype set consisted of three aluminum circular segmented jaws that were machined out of an aluminum billet. Shortly after that, the first order was placed for the new, innovative product.

Spurred on by cost-cutting techniques, an expanding product line and rapidly increasing acceptance of its Pie Jaw® innovation, Abbott emerged into national prominence in the early 1960s. By 1968 the company

name had changed to Abbott Aluminum Chuck Jaws, a division of How-Mil Enterprises, Inc. With the advent of CNC machines, the product line was further expanded to include tooling columns, tooling blocks, master plates and segments, angle plates and parallels.

In early 1990, Carl Reed joined Abbott Aluminum Chuck Jaws as President and Chief Executive Officer. Since then, many changes have taken place within Abbott, resulting in dramatic improvements in the quality, availability and affordability of an expanded line of products. However, the biggest change occurred in August 1993.

After 40 years of operating a business in Phoenix, Arizona, Abbott Aluminum elected to move its entire operation to Manhattan, Kansas. In concert with the relocation, Abbott further expanded its line of workholding products to include an extensive inventory of steel and aluminum straight jaws, cast iron and steel Pie Jaws® and a very comprehensive inventory of aluminum tooling columns, sub-plates and associated fixturing.

As a direct result of the increased manufacturing capabilities, Abbott changed its name to Abbott Workholding Products, which more accurately described the multiple product lines being manufactured in the 37,000 square foot Kansas facility.

Abbott is the originator of and industry leader in aluminum chuck jaws and other lightweight products. We use certified (99.8%) pure aluminum in our hammers to avoid material contaminations when utilized on exotic high-temperature metals. Abbott Pie Jaw® brand chuck jaws are made of 6061 T-6 or 319 cast

aluminum. All tooling columns (CNC tombstones) are made of 713 (Tenzaloy™) aged to T-6 condition.

As significant as any other single technological advancement in precision toolmaking, our revolutionary Pie Jaw® brand chuck jaws technology has benefited manufacturers in a host of industries by enabling them to drastically increase their productivity, quality and profits while reducing production costs. Pie Jaws® can be used in place of rectangular jaws in more than 75% of all machine tool applications. In most cases, manufacturers quickly realize the many inherent benefits they offer.

1. Concentricities and close tolerances are easily and consistently maintained.  
Production quality standards are significantly improved.
2. Gripping and holding of material is positive and effective without distorting thin-walled materials.
3. Machine and tool life are drastically extended due to more effective application of coolants.
4. Substantially lighter-weight jaws enhance operation utilization and shop efficiency.

Today, Abbott manufactures more than 4,000 aluminum, steel and cast iron straight and Pie Jaw® brand chuck jaws, as well as master plates, segments, tooling columns, sub plates, and a variety of accessories. The significant weight and cost advantages of aluminum tooling columns and fixtures have necessitated the emergence of the product line for Abbott with over 120 different sizes and configurations currently in production. Skilled technicians allow Abbott to service requests for special orders that require precise customer specifications. Currently, Abbott's products are achieving greater industry acceptance than ever before. We have established customers all across North America as well as internationally. With more than \$4 million in inventory, Abbott can provide fast, reliable, overnight delivery to most U.S. and international cities.

It is the dawn of a new era at Abbott Workholding Products. We are extremely proud of our

past accomplishments and industry heritage. We will continue to provide the guaranteed quality products and personalized service that have helped us earn our enviable reputation as the industry leader for over 60 years.

Although we view our yesterdays as stepping stones to tomorrow, Abbott is preparing for the future today by adding technologically advanced equipment and expanding our production facilities. What's more, we intend to create new products and opportunities that capitalize on our extensive Workholding experience, expertise and manufacturing capabilities.

However, while achieving our new milestones, one thing will never change—Abbott's unwavering commitment to develop more effective ways to increase your productivity and profitability.

Pie Jaw® is a registered trademark of Abbott Aluminum Inc.  
Tenzaloy™ is a registered trademark of Federated Metals Div., American Smelting and Refining Co.

**LIGHTWEIGHT chuck jaws**

IMPROVED QUALITY AND increased speed in lathe operations are moneysaving reasons for the use of aluminum chuck jaws developed by Abbott Engineering & Manufacturing Co., P. O. Box 10301, Phoenix, Ariz.

The Abbott chuck jaws, machined from Alcoa aluminum bar stock, minimize the possibility of scratching or marking parts being lathed. In addition, the company has found that they have as much as five times the grip of comparable steel chucks.

Because of aluminum's light weight, wear on spindle bearings is cut down, in turn permitting fast spindle speeds and feeds. Other advantages of the aluminum chucks include ease in handling and quick "set-up" time.

Abbott's line of chuck jaws and chuck pot fixtures covers practically any need in secondary machine operations.

## Pie Jaw® Advantages

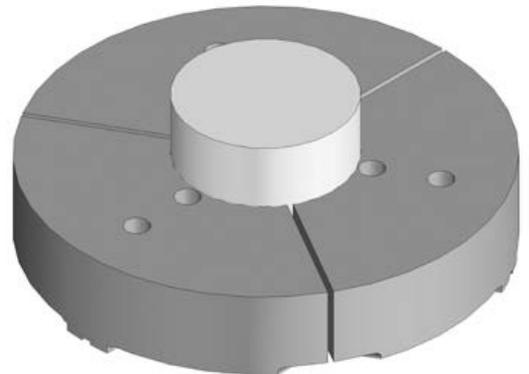

Abbott Workholding Products invented the lightweight aluminum Pie Jaw®.

*The Abbott Pie Jaw® offers you the ability to make more accurate parts faster than you ever have before.*

**T**he Abbott Pie Jaw® maintains 360 degrees of contact, so parts cannot deform, giving you a greater degree of accuracy. Our Pie Jaws® are designed to grip the part more effectively without distorting thin walled or odd-shaped parts.

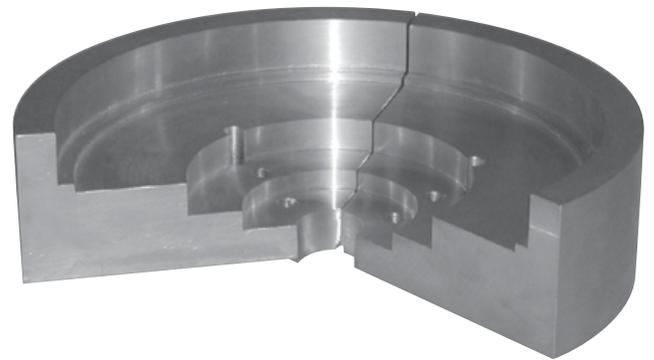

Standard soft jaws keep only three points of contact around the part. Constant chuck pressure could damage the part and at high rotations the part could deform between the contact points. Additionally, traditional soft jaws cannot be utilized on thin walled or odd-shaped parts without modification .

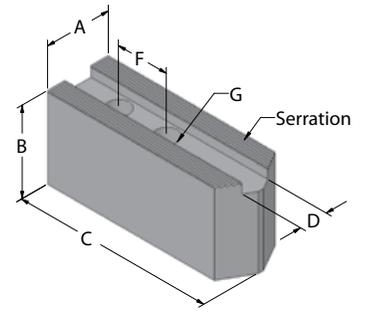

Most of our Pie Jaws® are made from aerospace aluminum alloys. The light weight of the aluminum Pie Jaws® enables you to rotate your chuck faster than before, so you can turn parts faster with less wear and tear on your machine. Substantially lighter weight jaws enhance operation utilization and shop efficiency.

Concentricities and close tolerances are easily and consistently maintained. In addition, machine and tool life are significantly extended due to more effective application of coolants.

In fact, Pie Jaws® can be used in over three-quarters of all your turning operations.

## 1.5mm X 60° Serrated Pie Jaws® — Style Q

Made with 6061 T-6 condition aluminum, 319 cast aluminum, cast iron, 1018 steel or A36 steel

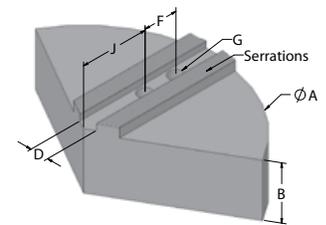

Add CI prefix to aluminum part # for cast iron jaws

Add ST prefix to aluminum part # for steel jaws

Cast iron version weight is approximately 2.6 times that of aluminum

Steel version weight is approximately 2.8 times that of aluminum

Dimensions in inches unless otherwise noted • Weights in lbs. • Custom configurations available

## 1.5mm X 60° Serrated Pie Jaws® — Style Q

– continued

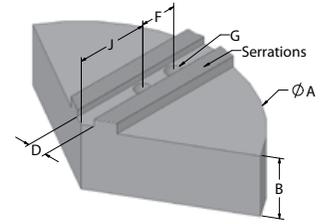

Made with 6061 T-6 condition aluminum, 319 cast aluminum, cast iron, 1018 steel or A36 steel

Add CI prefix to aluminum part # for cast iron jaws

Add ST prefix to aluminum part # for steel jaws

Cast iron version weight is approximately 2.6 times that of aluminum

Steel version weight is approximately 2.8 times that of aluminum

Dimensions in inches unless otherwise noted • Weights in lbs. • Custom configurations available

## 1/16" X 90° Serrated Pie Jaws® — Style K

Made with 6061 T-6 condition aluminum, 319 cast aluminum, cast iron, 1018 steel or A36 steel  
 Add CI prefix to aluminum part # for cast iron jaws  
 Add ST prefix to aluminum part # for steel jaws  
 Cast iron version weight is approximately 2.6 times that of aluminum  
 Steel version weight is approximately 2.8 times that of aluminum

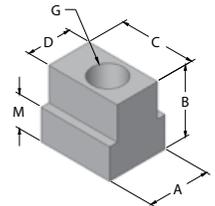

Dimensions in inches unless otherwise noted • Weights in lbs. • Custom configurations available

## American Standard Tongue & Groove Pie Jaws® — Style D

Made with 6061 T-6 condition aluminum, 319 cast aluminum, cast iron, 1018 steel or A36 steel  
 Add CI prefix to aluminum part # for cast iron jaws  
 Add ST prefix to aluminum part # for steel jaws  
 Cast iron version weight is approximately 2.6 times that of aluminum  
 Steel version weight is approximately 2.8 times that of aluminum

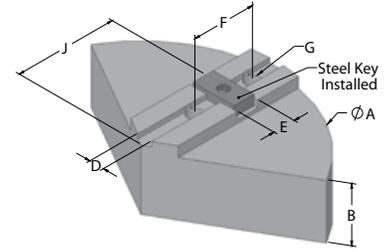

Dimensions in inches unless otherwise noted • Weights in lbs. • Custom configurations available

## American Standard Tongue & Groove Pie Jaws® — Style D

– continued

Made with 6061 T-6 condition aluminum, 319 cast aluminum, cast iron, 1018 steel or A36 steel  
 Add CI prefix to aluminum part # for cast iron jaws  
 Add ST prefix to aluminum part # for steel jaws  
 Cast iron version weight is approximately 2.6 times that of aluminum  
 Steel version weight is approximately 2.8 times that of aluminum

Dimensions in inches unless otherwise noted • Weights in lbs. • Custom configurations available

## American Standard Tongue & Groove Pie Jaws® — Style D

— continued

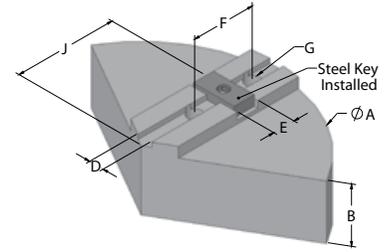

Made with 6061 T-6 condition aluminum, 319 cast aluminum, cast iron, 1018 steel or A36 steel

Add CI prefix to aluminum part # for cast iron jaws

Add ST prefix to aluminum part # for steel jaws

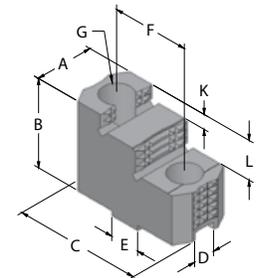

Cast iron version weight is approximately 2.6 times that of aluminum

Steel version weight is approximately 2.8 times that of aluminum

Dimensions in inches unless otherwise noted • Weights in lbs. • Custom configurations available

## Metric Tongue & Groove Pie Jaws® — Style D

Made with 6061 T-6 condition aluminum, 319 cast aluminum, cast iron, 1018 steel or A36 steel  
Add CI prefix to aluminum part # for cast iron jaws  
Add ST prefix to aluminum part # for steel jaws  
Cast iron version weight is approximately 2.6 times that of aluminum  
Steel version weight is approximately 2.8 times that of aluminum

Dimensions in inches unless otherwise noted • Weights in lbs. • Custom configurations available

## Aluminum Hammers

Abbott aluminum hammers are the perfect alternative to lead, brass and plastic tipped hammers. Single piece cast construction gives maximum solidity and guarantees safety because head cannot separate from handle. The hammers are non-sparking, non-marring and have excellent vibration dampening characteristics that allow the handle to absorb impact forces instead of your hand. Abbott #1 & #2 hammers are made from certified pure A100 aluminum, which makes them non-contaminating when working with exotic high temperature metals. Abbott #5, & #10 hammers are made from 356-T6 aluminum alloy, making them the perfect choice for heavy work where a more durable and forceful hammer is preferred, without sacrificing non-sparking and non-marring characteristics.

### Aluminum Hammers

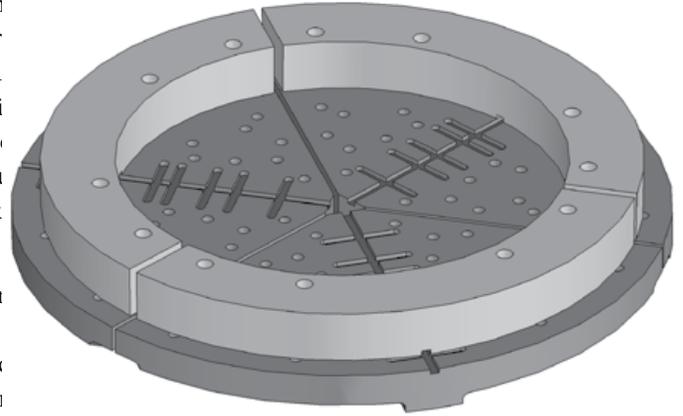

Dimensions in inches unless otherwise noted • Weights in lbs. • Custom configurations available

| PART #   | ALLOY  | FACE SIZE  | LENGTH | WEIGHT |
|----------|--------|------------|--------|--------|
| 1HAMMER  | A100   | 1 5/8" DIA | 12     | 1.8    |
| 2HAMMER  | A100   | 2" DIA     | 13     | 3.3    |
| 5HAMMER  | 356-T6 | 3" DIA     | 22     | 9.1    |
| 10HAMMER | 356-T6 | 4" DIA     | 29     | 16.3   |

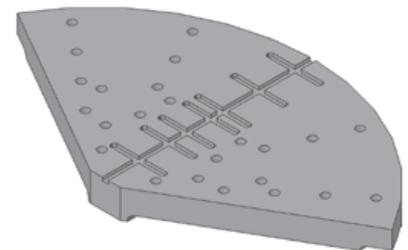

# Master Plates

Abbott's master plate and segment system is a great choice for turn diameter work pieces. The system consists of an aluminum master plate similar to a thin Pie Jaw®, which is pre-drilled and keyed to accommodate Abbott's standard, off-the-shelf segment rings. Plates are available in diameters from 15 to 60 inches and can be mounted on 8-60 inch chucks, effectively increasing the holding capability of smaller chucks. Master plates can be custom machined to fit any model chuck, making a permanent universal fixture on any machine.

When using this system, the transition from one job to the next simply requires bolting on a new size or configuration of segments before the next production run. For repeat jobs, machine operators can create job specific tooling, allowing them to setup in minutes by using machined segments from a previous run. Segments are available in specific ID/OD ranges, allowing machining time to be spent on making production parts instead of boring out excess jaw material. The master plate and segment system maximizes flexibility between machines because segments can be used to run jobs on any machine that has been fitted with a master plate, regardless of machine or chuck type. In addition to reduced setup and tool preparation time the system enables material and shipping cost savings as well.

- Universal quick change system for any chuck
- Reduce setup and changeover times by up to 80%
- Ideal for machining larger diameter thin walled parts
- Eliminate out of round conditions and concentricity problems
- Effectively double the holding capacity of any chuck without eliminating the ability to hold small parts

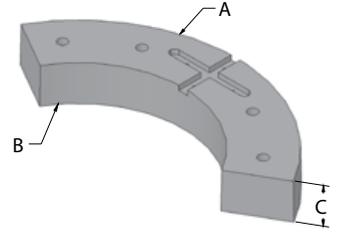

## Master Plates — Style N

Made with 713 Tenzaloy™ aluminum alloy

# Precision Master Plates

When it comes to turning/holding smaller diameter parts Abbott's precision master plate and segment system is an ideal choice for high changeover and short running jobs. Due to the system's high repeatability, it is an excellent alternative to more expensive quick change chucks. The system consists of an aluminum master plate, similar to a thin Pie Jaw®, which is bored and bushed to accommodate Abbott's standard, off-the-shelf pinned segments. Plates are available in 8, 10 and 12 inch diameters and can be mounted on 4-12 inch diameter chucks. The master plate can be custom machined to fit any model chuck, making it a permanent universal fixture on any machine.

When using this system, the transition from one job to the next simply requires bolting on a new size or configuration of segments before continuing with the next production run. For repeat jobs, machine operators can designate job specific tooling, allowing them to setup in minutes by using pre-machined segments from a previous run. The master plate and segment system maximizes flexibility between machines because segments can be used to run jobs on any machine that has been fitted with a master plate, regardless of machine or chuck type.

- Universal quick change system for any chuck
- Reduce setup and changeover times by up to 80%
- Eliminate out of round conditions and concentricity problems
- Repeatability < 0.001" TIR

## Precision Master Plates — Style N

Made with 713 Tenzaloy™ aluminum alloy

Dimensions in inches unless otherwise noted • Weights in lbs. • Custom configurations available

| CHUCK RANGE | BASE PART# | DIAMETER | SEGMENT DIAMETER RANGE    | WEIGHT |

## Mounting Top Jaws

Safe and effective use of top jaws requires strict adherence to established safety guidelines. Consult the machine and chuck manufacturer's operating manual for safe use and limitations. In preparation, wipe the mounting face of each master jaw, and each top jaw, clean off all dirt and chips. Inspect each top jaw before mounting to verify a good material condition.

Now carefully mate the top jaw to the master jaw, making sure of a proper fit between all components. Insert jaw mounting bolts and tighten them evenly and firmly. Use

only high quality fasteners. CAUTION: IT IS CRITICAL THAT THE BOLTS BE OF PROPER LENGTH FOR THE PARTICULAR TOP JAWS BEING USED - see illustration below. Bolts that are TOO LONG will extend through the jaw nut, bottom out, and give the appearance of being properly torqued while not actually securing the top jaw in place. Bolts that are TOO SHORT will have insufficient thread engagement in the jaw nut, and could result in the jaw nut fracturing. Ensure that the master jaw still moves without binding.

**Incorrect**  
**Bolts too long**

**Incorrect**  
**Bolts too short**

**Correct**  
**Full engagement**

## Boring Soft Jaws

The accuracy and concentricity of the soft top jaws is established by precisely boring, or turning, the jaws while mounted on the chuck, in the gripping position. Always carry out this operation with the chuck jaws under pressure, in the same direction as they will be used. For external applications, load the chuck by gripping on a plug and bore the jaws to the dimension of the workpiece. For internal

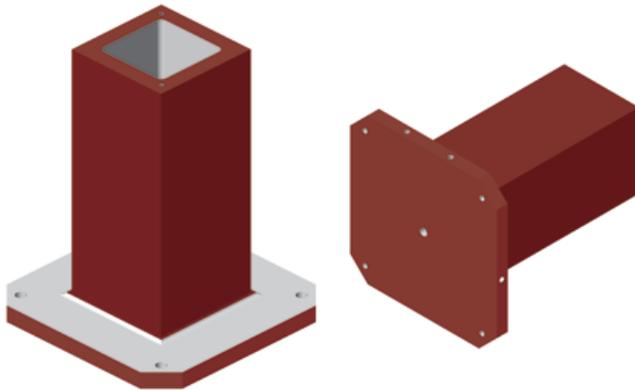

work, load the chuck by opening against a ring or band and turn the gripping surface to the dimension of the workpiece. The pre-loading operation can also be quickly and effectively done with a boring ring. Effective contact between the gripping surface of the jaws and the workpiece may be confirmed by inserting pieces of tissue paper, and then applying chuck pressure.

Always ensure that you have a balanced combination of chuck, jaws, and workpiece. Special care should be given when using oversized jaws. Consult your chuck manual to help determine the maximum safe operating speed for your application. Use of a grip-force analyzer is also recommended.

# Tooling Columns

## Tenzaloy™ Tooling Columns

Abbott tooling columns, made of Tenzaloy™ naturally aged to T-6 condition, provide a practical, inexpensive and lightweight means of holding work accurately in a vertical or horizontal plane for CNC machining operations. They can be mounted directly on a machine table/pallet or used in conjunction with a rotary table. Standard Abbott tooling columns are available in multiple configurations built to any height, width and thickness dimensions required for your application. In addition, base sizes can be customized to fit any machine pallet.

■ Unmachined Surface  
■ Machined Surface on BS Configuration

### Standard tooling column configuration

**BS (base & sides)**—overall height machined, base machined with pallet specific mounting details and faces machined with .015" additional stock

- Columns are designed to be machined to listed nominal dimensions
- As cast areas have additional stock
- Larger & smaller size bases available upon request

### Tooling Columns:

- Strong, Rigid & Lightweight
- Vibration Dampening
- Corrosion Resistant
- Excellent Machinability
- Custom Sizes and Configurations Available

### Turn Key Solutions:

- In House Design Engineering
- Custom Fixturing

## 713 (Tenzaloy™)

### General Advantages and Characteristics

#### High Strength

Tenzaloy™ is a high-strength aluminum casting alloy that has tensile yield and elongation properties equivalent to the common heat treated alloys such as 195T6, 355T6 and 319T6. The impact strength of Tenzaloy™ is greater than any of these alloys, and in several instances the elongation is higher.

Tenzaloy™ attains its strength by a natural aging process that gradually takes place at room temperature. The typical properties are reached after 10-14 days, and when testing for specification purposes, a 21-day period is used. Some slight further aging and strengthening takes place up to six months, at which time the alloy is stable and no further change of any kind takes place. Test bars held for six years at room temperature have shown that the properties remain constant.

#### Elimination of Heat Treatment

Because Tenzaloy™ is self-aging, no heat treatment is required. The first and most obvious advantage gained is the saving of the cost of the treatment and the extra freight often involved if the heat treating is being done outside the foundry. The process of heat treatment is far from a fool-proof operation, and is subject to many errors and failures (both man and machine).

The solution heat treatment is carried out at as high a temperature as possible for maximum efficiency. This temperature is just below the melting point, and a common cause of difficulty is overheating due to faulty temperature control or hot spots in the furnace. This overheating often results in warped, cracked and, occasionally, melted castings, which are then a complete loss.

The quenching operation which follows solution heat treatment can cause substantial problems with regard to warpage and cracking. When distortion occurs, the castings must be straightened—a troublesome operation which must be performed within a short time after quenching, while the castings are soft.

#### Stress-free, Full-strength Castings

If Tenzaloy™ is given a simple heat treatment of six hours at 468° C. and allowed to air cool (not quenched) it will age normally and result in a stress-free, full-strength casting. This is not possible with any heat treated alloy.

All castings of any alloy will contain internal stresses as a result of the casting process. The solution heat treatment cycle of the heat treated alloys will eliminate these cast stresses, but the quenching operation introduced much greater ones. Conventional T6 aging treatments do not relieve these stresses. Aging treatments which do relieve these quenching stresses (such as T71) result in inferior properties. The cast stresses can be relieved by a simple, one-step aging treatment (T5) but here again inferior properties result.

Thus, through the use of Tenzaloy™, it is possible to obtain castings that have their full strength and yet are stress-free. This is important for uses where close dimensional and straightness tolerances must be maintained, especially where the castings are extensively machined.

#### Dimensional Stability

Tenzaloy™ is dimensionally stable and does not grow or increase in size as do the heat treatable alloys. Actually, fully aged Tenzaloy™ shows a very slight decrease in length of less than 0.025mm per 25.4mm. In contrast to this, heat treated alloys can increase in size as much as 0.10% to 0.15% (0.025mm to 0.038mm per 25.4mm).

#### Machinability

The machinability of Tenzaloy™ is exceptionally good—equal to the very best of aluminum alloys, such as the aluminum-magnesium types. The machinability is greater than the common aluminum-copper or aluminum-silicon heat-treatable alloys. Often it will be found that several machining steps can be eliminated because Tenzaloy™ attains a fine finish with fewer cuts. Also, Tenzaloy™ may be machined at the highest possible speeds. As can be seen from the mechanical property tables and aging curves, immediately after casting, the alloy is relatively soft and ductile. If machined at this point the castings will give the impression of being gummy. Even though many machining operations are performed soon after casting, best results will be obtained if the castings are allowed to age about five days. Although the typical properties are not reached until ten to fourteen days, sufficient hardening will have taken place in five days to materially improve machinability.

Tenzaloy™ is readily polished to a high luster with a silvery-white color. The time when the ability to be polished will be best will vary somewhat with the preferences of the polisher. One who prefers a soft metal, easily smeared, will like to polish soon after casting. One who prefers a hard metal easily cut, will prefer a casting that has aged and hardened.

#### Anodizing

Tenzaloy™ can be readily anodized by standard procedures and will produce a white color superior to alloys containing copper and/or silicon. The anodized coating may be dyed any available color. It should be emphasized that the surfaces of sand castings in any alloy are prone toward porosity of many kinds, and that if coloring is being considered, the surfaces must contain a minimum of porosity for satisfactory dye application.

#### Brazing

Because of its high melting range of 607-652° C., Tenzaloy™ is one of the few casting alloys which can be brazed at temperatures of 552-607° C. Conventional techniques may be used, such as oven, torch or flux-bath dip methods. Tenzaloy™ can be brazed to itself, to extruded aluminum sections, or to other forms of the proper alloys.

#### Corrosion Resistance

Tenzaloy™ has excellent corrosion resistance, equivalent to the aluminum-silicon alloys. Tenzaloy™ compares favorably with other high strength alloys in that the alloy is not susceptible to acceleration of corrosion by stress (below 80% of the yield strength) nor to stress corrosion cracking. The alloy exhibited a negligible loss of mechanical properties after immersion in aerated 3% water solution of sodium chloride for ninety days, and the small surface attack that was present was found to be uniform without pitting. This uniformity of resistance is not encountered with the aluminum-silicon alloys commonly considered to be corrosion resistant.

## General Applications

Since Tenzaloy™ has mechanical properties equivalent to the common heat-treated alloys, it may be substituted in applications where a heat-treated alloy is presently being used. Tenzaloy™ is used in any high strength application where load carrying capacity and impact strength is desired. This may be almost any type of casting of this nature, including frames, brackets, levers, bases, housing, heavy duty fan blades, etc. The high machinability and fine finishes obtainable have been sufficient reason alone for the use of Tenzaloy™ in many instances.

Tenzaloy™ has often been used for the production of large, high strength castings where heat-treated alloys could not be used because of the lack of sufficiently large heat treating facilities.

The dimensional stability, ease of machining, and the ability to make stress-free castings is of great value in applications where strength and close tolerances are essential, such as instrument frames, housings and components.

The ability to be brazed has resulted in the widespread use of Tenzaloy™ (cast by all methods) for such things as radar wave guide, plumbing and gasoline pump fittings.

The ease of polishing and brilliant surface obtainable make it ideal for castings requiring this type of finish.

Tenzaloy™ has been successfully used in applications involving pressure tightness. In such applications, as with all aluminum alloys, particular attention must be given to gating and risering to insure proper feeding of the casting.

Tenzaloy™ has replaced malleable iron in many applications, often with no changes in design. In other instances, the change has been made with but minor changes in design to compensate for the lower modulus of elasticity of aluminum as compared to iron base alloys. Many small brackets, levers, and particularly anything that must be carried, lifted, or shipped long distances, can be advantageously converted to Tenzaloy™ alloy.

Tenzaloy™ is most easily welded by the insert gas shielded arc process using 43S or similar filler rod. By this means, excellent welds may be obtained between Tenzaloy™ components and between Tenzaloy™ and most other aluminum shapes, cast or wrought. High strength welds can be obtained with the use of Tenzaloy™ filler, but greater skill is necessary.

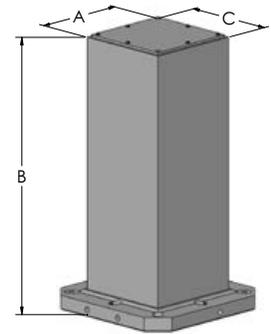

# Universal Mount Tooling Columns

Abbott's pre-machined universal mount columns are available as a stock option to our standard made to order fixtures. Machined bases include both center and edge locating details as well as a selection of slotted mounting bolt holes, allowing them to be used on virtually any machine tool with corresponding pallet size. In addition to the universal base machining, the faces are machined per "BS" specifications and a top plate is provided when applicable. An adaptor washer kit is provided for use with 1/2-13 or M12 mounting bolts.

## Warranty

**A**BBOTT warrants that its goods will conform to the description and specifications as set forth in the latest ABBOTT product catalog or in purchase orders received and accepted by ABBOTT.

ABBOTT further warrants that the goods shall be free from defects in material and workmanship. Minor surface porosity is not to be considered a defect for purposes of this warranty.

This warranty is expressly made in lieu of any and all other warranties, expressed or implied, including the warranties of merchantability and fitness. There are no other warranties which extend beyond the description in this agreement.

### Limitations of Remedies

The exclusive remedy in the event that any of the goods do not conform to the description of ABBOTT's standard warranty shall be replacement or repair of the goods at the option of ABBOTT.

Except as otherwise agreed upon herein, ABBOTT shall not be liable for special or consequential damages, such as, but not limited to, damage or loss of other property or equipment,

loss of profits or revenue, loss of use of power system, cost of capital, cost of purchased or replacement parts or claims of third persons or parties.

The remedies set forth herein are exclusive and the liability of ABBOTT with respect to goods sold or ancillary claims arising from the use of any goods manufactured by ABBOTT, whether such remedies are based on contract, tort, strict liability or other warranty theories, shall not, except as expressly provided for herein, exceed the price of the goods or the part or portion of the goods on which such liability or claim is based.

All goods claimed to be non-conforming must be shipped to MANUFACTURER's Manhattan, Kansas plant at MANUFACTURER's expense. Such goods will be repaired or replaced within a reasonable time. ABBOTT's acceptance of any goods so shipped shall not be deemed an admission that the goods are non-conforming, and if ABBOTT finds that any goods returned are not defective, such goods will be re-shipped to purchaser and purchaser will be charged all shipping charges incurred by ABBOTT.

### Return Policy

#### Standard Chuck Jaws

All standard chuck jaws may be returned to Abbott within 6 months of invoice/shipping date.

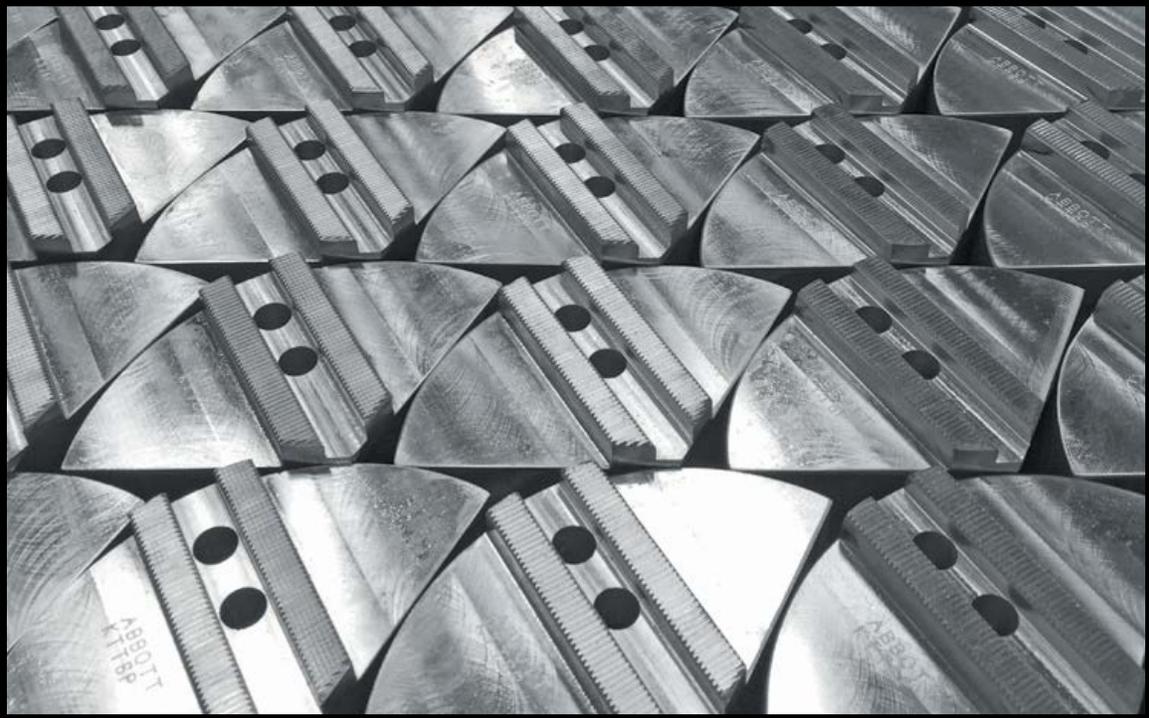

After 6 months from invoice date, goods may not be returned unless special circumstances exist and return is approved by Abbott.

All returned goods must be assigned an RMA number by Abbott prior to being returned. All returned goods must be inspected by Abbott and accepted into inventory prior to credit being applied.

All returned goods are subject to a 15% restocking fee unless Abbott is at fault due to inaccurate order processing or incorrect manufacturing.

#### Made to order chuck jaws, master plates and fixtures

All made to order products, including special chuck jaws, master plates and fixtures, may not be returned unless special circumstances exist and return is approved by Abbott.
